

Manipal Hackathon 2026

Team Name: Auditly

Track: Smart Governance & Compliance

Problem Statement: Unverified Post-Award Subcontractor Variations

Solution Title: Auditly, an AI Powered Public Procurement Intelligence Platform

Team Members: Shreesha Aithal, Pranav S Salian, Jnandeep Rai, Shetty Akash Sadasiva

Solution

Two audiences, one broken system, and four ways Auditly fixes it

Governments lose the thread: contractors, scopes and costs shift quietly after award, with evidence scattered across systems.

Contractors can't find their fit: tenders are scattered across portals with eligibility rules buried in dense documents.

Auditly connects both sides through one shared intelligence layer:

Contract Change Detector

Continuously compares the awarded contract against amendments, reports and payments to flag deviations in cost, scope, materials, timeline or subcontractors.

Evidence Linker

Checks every flagged change against approvals, change orders, inspection reports and invoices, marking it verified or unverified.

Investigation Priority Score

Ranks flagged contracts using financial variation, evidence gaps and relationship signals, with a plain language reason for every score.

AI Tender Matching Engine

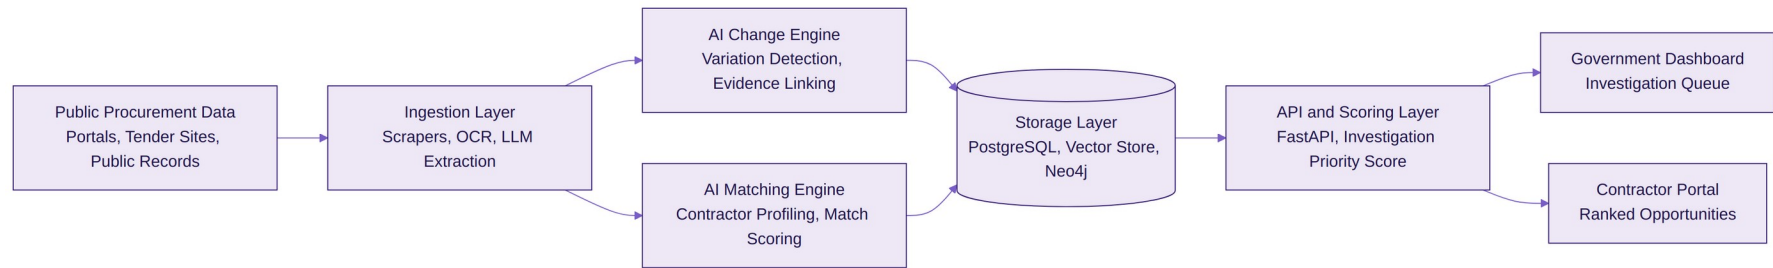

Profiles contractor capability, scores fit against open tenders and explains the match, gaps and deadlines in plain language.

Technical Implementation

End-to-end pipeline, from public data to government and contractor apps

Public data is ingested and parsed, run through AI change detection and matching, persisted across three purpose built stores, then served through a scoring API into both applications.

Tech stack

Python

FastAPI

React

Node.js

PostgreSQL

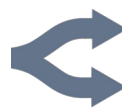

Neo4j

Docker

TypeScript

OpenRouter

36-Hour Build Plan (Round 2)

Hrs 0 to 8

Ingestion and document parsing on sample data

Hrs 8 to 20

Change detection, evidence linking and matching engines

Hrs 20 to 30

Government and contractor facing dashboards

Hrs 30 to 36

End to end integration, testing and demo polish

Feasibility

Why this is buildable now, not just in theory

Technical feasibility

Tender portals and contract documents are already digitized and structured well enough for LLM powered extraction, and mature diff and embedding models make change detection tractable today.

Data feasibility

Most government procurement portals already publish tenders, awards and amendments openly, giving a real ingestion path without needing new disclosure laws first.

Scalability

A cloud native pipeline with modular scrapers per portal lets Auditly add new agencies, states or countries by plugging in a new adapter, not rebuilding the core.

Team capability

Our skillset spans full stack development, NLP based document parsing and graph based relationship modeling, covering every layer this system needs.

Business Strategy

Users, business model, impact and roadmap

Who it serves

-  Government procurement officers and auditors
-  Corruption watchdogs and oversight bodies
-  Contractors and SMEs bidding on public tenders
-  Journalists and civic tech researchers

Impact, UN SDG 16

- Transparency in public spending across the contract lifecycle
- Accountability through evidence linked audit trails
- Accessibility of opportunities for smaller, legitimate contractors
- Evidence based oversight in place of blanket suspicion

Business model

- Subscription licensing for government agencies and oversight bodies
- Freemium tender matching for contractors, free to browse and match
- Premium tier for deep eligibility analysis and deadline alerts
- Data licensing for research and civic transparency partners

Roadmap

-  **MVP:** Change detector and evidence linker on sample data
-  **V2:** Priority scoring and relationship graph
-  **V3:** Contractor facing tender matching engine
-  **Pilot:** Live pilot with a state procurement portal
